Dr. Landry

Winter 2014

1. Explicate in terms of open and/or closed truth trees.

(a) Quantificational validity

An argument of **PL** is quantificationally valid if and only if the set consisting of the premises and the negation of the conclusion of the argument has a closed truth tree.

(b) Quantificational equivalence

Two sentences **P** and **Q** of **PL** are quantificationally equivalent if and only if the set  $\{\neg(\mathbf{P} \equiv \mathbf{Q})\}$  has a closed truth tree.

2. Use the tree method to show whether:

(a) is quantificationally true

(b) is quantificationally valid

(c) sentences are quantificationally equivalent

(d) quantificational entailment holds

(a)  $[Fa \supset (\forall x)Fx] \supset [(\exists x)Fx \supset (\forall x)Fx]$

1	$\neg[[Fa \supset (\forall x)Fx] \supset [(\exists x)Fx \supset (\forall x)Fx]]\checkmark$	SM
2	$Fa \supset (\forall x)Fx\checkmark$	1 $\neg \supset$ D
3	$\neg[(\exists x)Fx \supset (\forall x)Fx]\checkmark$	1 $\neg \supset$ D
4	$(\exists x)Fx\checkmark$	3 $\neg \supset$ D
5	$\neg(\forall x)Fx\checkmark$	3 $\neg \supset$ D
6	$(\exists x)\neg Fx\checkmark$	5 $\neg\forall$ D
7	$Fb$	4 $\exists$ D
8	$Fc$	6 $\exists$ D
	/ \	
9	$\neg Fa \quad (\forall x)Fx$	2 $\supset$ D

Since this tree is not closed, the sentence is not quantificationally true.

$$(b) \quad \frac{(\forall x)[Nx \supset (\exists y)Rxy] \quad \neg(\exists x)Rxx \wedge Na}{(\exists y)Ray}$$

$$(c) \quad [(\forall x)Fx \supset Ga] \equiv (\exists x)(Fx \supset Ga)$$

$$(d) \quad \{(\forall x)[(\exists y)Hg(x, y) \supset Bg(x, x)], Ha, a = g(a, b)\} \models (\exists y)Bg(y, y)$$

3. Why does the rule *Existential Decomposition* require that the instantiating constant **a** be foreign to all preceding lines of the branch?

By not requiring *Existential Decomposition* to introduce foreign constants we have opened up the possibility that the same constant can be reused in a conflicting predicate. So, we require foreign constants with *Existential Decomposition* in order to preserve truth, validity, equivalence, etc.
