(b) The hint given provides some intuition. We have to realize what happens when we see a new binary digit. Given the current value p :

- i. If the next digit is 0, then we have $2p$.
- ii. If the next digit is 1, then we have $2p + 1$.

We can catalog the effect in a table.

$p \equiv n \pmod{7}$	$2p \equiv n \pmod{7}$	$2p + 1 \equiv n \pmod{7}$
0	0	1
1	2	3
2	4	5
3	6	0
4	1	2
5	3	4
6	5	6

We can then map these directly to states, where 0 is the only accepting state.
